THE CHAIRMAN OF THE COUNCIL, Councillor STILLINGFLEET

October, 1949.

TO THE CHAIRMAN AND MEMBERS OF THE PUBLIC HEALTH COMMITTEE, SPENBOROUGH URBAN DISTRICT COUNCIL.

Mr. Chairman, Ladies and Gentlemen,

I have the honour to submit to you the Annual Report relating to the Urban District of Spenborough and the work of the Health Department for the year 1948.

Page Preface

The National Health Service Act which came into operation on the 5th July releases the Spenborough Council from many of the tasks which it has willingly undertaken in the past in connection with the Preventive Medical Services, and the opportunity is therefore taken of sketching very briefly the development of these services in Spenborough over the past twenty years. This will perhaps be of interest to local residents, and to those who have played their part in bringing them into being. This development is sketched in the preface to this report.

Pages Vital Statistics.
14, 18
The vital sta

The vital statistics of 1948 provide a striking example of the adaptability of the human race to its environment and of its powers to survive. Thus, in spite of our filthy atmosphere, our high proportion of bad houses, our overcrowding, our unsolved problem of tuberculosis, our dietary insufficiencies, our unclean food, our neglect of the aged, and the existing gaps in the knowledge of prevention and cure of many diseases, only 463 people died during the year, and of these, over a half occurred in the age group 65 and over, mainly from the so-called diseases of degeneration, i.e., heart disease, cancer, and diseases of the circulatory system. The death-rate of 12.6 is higher than that for towns of similar size throughout England and Wales but is not standardised for age. The biggest increase in the cause of death has been in regard to cancer with 19 cases more than in 1947. These figures do not show, of course, the vast amount of avoidable sickness and distress caused by the factors mentioned above. The birth-rate fell to 17.6 and is also below the average for towns of similar size. The Infant Mortality Rate shows a substantial increase over last year, being 40.5 as against 30.4. This was somewhat to be expected, with a falling birth-rate succeeding an abnormally high one in the preceding year, and, is at a disadvantage compared with the return for England and Wales, which is related to the The children under one year of age who died in 1948 were not necessarily born in that year. Actually there were four more infant deaths in 1948 than in 1947, and I do not regard this as in any way significant. The main causes of infant deaths are premature birth and congenital malformations, which account for 15 cases. There were no deaths among illegitimate infants under one year. The stillbirth-rate, although lower than last year, is still depressingly high.

Pages Infectious Diseases.

Once again measles, whooping cough and chicken pox were by far the most prevalent of the infectious diseases and account for 838 of 985 cases notified. There was one death from measles and one from whooping cough, both in infants under one year of age. There were no notifications of "major" infectious disease other than five cases of diphtheria, all of which were comparatively mild, and three of which occurred in adults. Only one case had received immunisation, and that two years previously.

Page Diphtheria Immunisation.

Our main efforts towards securing a high percentage of immunised children has once again been concentrated on the personal approach to the parents, with a check point at the first year of attendance at school. This had good results and 814 children have been immunised during the year. I now estimate that 51 per cent. of children age 1—5 years and 76 per cent of children 5—15 years are protected against diphtheria. These figures are compiled from our own returns of births and immunisation.

Page Tuberculosis.

Another problem which does not seem capable of early solution is shortage of hospital beds for cases of tuberculosis. It is a matter of great distress to myself and to the Tuberculosis Officers to see cases which would undoubtedly benefit by early hospitalisation having to wait many months before they can hope to be admitted, and in the meantime are a source of danger to all who come into contact with them.

Pages Maternity. 27-28

The Ante-Natal Clinics continue to be well attended with the result that 64 per cent of the expectant mothers received their ante-natal care, either wholly or in part, through our clinics. The effect of the National Health Service Act has scarcely yet been felt by the clinics, but it seems certain that this percentage will drop, and that some of the expectant mothers will seek their ante-natal care through their own general practitioner. There appears to be neither advantage nor disadvantage in this unless the practitioner proposes to conduct the confinement personally when continuity of medical care would be achieved. Samples of blood of all women attending the ante-natal clinics are examined for anæmia, rhesus factor and syphilis as a routine measure.

Approximately 52 per cent. of all confinements took place in maternity homes or other institutions, as against 32 per cent. in the previous year. It is to be expected that the number wishing to have their confinements in maternity homes will increase under modern conditions, and it therefore becomes necessary to point the need for a new maternity home, properly equipped and capable of dealing with every emergency, within this area. After all, maternity accommodation is one aspect at least of the hospital services which should be decentralised, and while Crossley Maternity Home is serving a very useful function it was brought into being largely as an expedient to provide better conditions for normal confinements than are commonly present in the houses of the area. A number of expectant mothers were unable to obtain maternity accommodation because their home circumstances appeared to be adequate to their needs, and because of the shortage of beds for normal maternity cases.

Page 19 Of 27 premature births recorded during the year only five of these were born at home, and in those cases which survived, the midwives continued to attend until the infant weight and development reached a satisfactory level. Special equipment for the nursing of these infants in their own homes is available through the Health Department.

Page Home Nursing.

To me, one of the pleasant features of the National Health Service Act has been to bring the Home Nursing Service within the compass of the Health Department. The nurses concerned have passed to the employment of the County Council and are administered through my office. This has brought no difficulties at all, and I have at all times found the nurses to be most willing and co-operative. It is undoubtedly an advantage that Home Nursing has become part of the Public Health and Preventive Services; much can be achieved through co-operation with other sections which did not exist previously.

Page 29

Child Welfare.

Attendances at our Infant Welfare Centres throughout the year have been very high. This is very pleasing and would seem to show that the attention and the advice available at these centres is highly appreciated. On the other hand, it is my personal feeling that if an adaquate and regular routine of home visiting can be achieved by our Health Visitors, it should seldom be necessary for mothers to bring infants in their first months of life to the Welfare Clinics. The place for advice and instruction to be given is in the home. It then becomes much more personal, and can be adapted to the environment and the personal likes and dislikes of the mother. Our aim for the future will be to secure that each child is visited in its home at least once each week for the first three months of life, fortnightly for the second three months, and monthly thereafter until one year. During this period the Health Visitor can get over to the mother in a personal way the basic principles of infant care and the upbringing of children. There would be a further advantage in this system in that a very complete record of the diseases of early infancy could be obtained, and this would be of particular value for such ailments as gastro-enteritis, which is not a notifiable disease and which one feels could not satisfactorily be made notifiable, but which nevertheless takes its toll of infant life. These visits can, of course, be supplemented by attendances at the clinic, particularly between the ages of one year and entry to school, during which time it is increasingly obvious that advice is required by many on such subjects as footwear, clothing, diet, immunisation against disease, enuresis, physical and mental defects, and the future education of the child. Personally, too, I should like to see the discontinuance of the sale of baby foods at all clinics so that the main emphasis would once again revert to the educative and medical aspect. The time has surely come when the sale of these foods can revert to the normal commercial channels, and if their cost is too great it should not be a difficult matter to adjust, either by control or subsidy.

Birth Control

There appears to be no policy at all with regard to family planning or birth control. I feel certain that the establishment of a proper Birth Control Clinic in the area would be very greatly appreciated by many people, and would do a great deal of good, not only in removing an element of fear of unplanned families which exist in many marriages, but in removing the physical and psychological disturbances of ignorance of birth control methods. This knowledge should be available to all, whether married or not, for while no one would wish to encourage illicit intercourse it will always exist on a very considerable scale, and the tragedy of the unwanted child is so great both from the child's point of view and that of the unmarried mother that it would well repay us to make readily available the means of avoiding this.

Day Nursery

The Day Nursery at Moorend continues to work to capacity, and has a waiting list of approximately 60. Admissions are arranged on the basis that those whose need is greatest receive priority. There were no cases of outstanding hardship on the waiting list at the end of the year. Except where the need is inescapable it is quite wrong that very young children should be separated from the care of their mothers during the greater part of the day, and I feel that the present-day nursery accommodation is sufficient to meet the socio-medical needs of the district. Whether there is a case for the provision of further nursery schools I do not propose to discuss in this report.

Page Problem Families.

The supervision of Problem Families has continued unremittingly, in odd cases not without sucesss, and I have to record my appreciation of the good work done by the National Society for the Prevention of Cruelty to Children, which has co-operated most fully with my department. This work constitutes one of the least pleasant of the very many tasks of the modern health visitor, and one which is, on comparatively few occasions, rewarded with substantial achievement. If, as I believe, the main cause of problem families is due to defective intellect plus defective character, this is not surprising, and I wish to record my admiration of the manner in which the health visitors have stuck to their uncongenial task.

Domestic Help.

Page 31

The Home Help Scheme was little sought after until the transference of this scheme to the County Council. Because of the widening scope of its activities, and particularly because of the extremely generous scale of recovery of charges, the latter half of the year showed that this service was one which was likely to expand enormously. This may be a good thing but I hope it will not tend to make people regard lightly their moral responsibilities for looking after their own kith and kin.

School Medical Services.

Pages 32-35

A brief section in connection with school medical work is included to give some indication of the health of the school children of the area, and the medical services available. The main factors are the large number of children which it was found possible to examine with the increased medical assistance available, and the eyesight of every child attending school was tested, both at school, and if thought necessary, by the consultant ophthalmologist employed for this work. Out of 242 cases referred to the ophthalmologist, glasses were prescribed in 191 cases.

The work of ascertainment in connection with physically and mentally handicapped children proceeded increasingly, and much yet remains to be done. The position with regard to educationally subnormal children is, of course, quite fantastic. There is little or no hope of them being admitted either to special schools or to special classes, and they therefore continue to attend their ordinary schools, being moved up a class each year according to age and falling further and further behind. There is no doubt at all that this is bad for them psychologically, and must in many cases hinder the work of the class.

There is great need for a Child Guidance Clinic to be readily available. At the present moment we are able to secure occasionally an appointment at the Child Guidance Clinic at Barnsley. Being remote, however, this is liable to lead to broken appointments, and tends to make us reserve only the worst cases for such an investigation, the result being that by the time that the child is seen at the Clinic the maladjustment may have progressed so far that either improvement is hopeless, or the job made very much harder.

The services of a physiotherapist became available to the Division in September of this year, and this gives an opportunity for the children of the area to receive locally remedial treatment for orthopædic defects, chronic bronchitis, asthma and the like. Although no figures are available it is my impression that a high proportion of the school children in this district suffer from recurrent bronchitis or from asthma.

Largely in the nature of an experiment, permission was given to me for the employment of a chiropodist in connection with the School Health Service, on a sessional basis of two half-days per week. It was quickly evident that I had underestimated the demand and the need for this service, as a glance at the figures in the body of the report will show. Cases were referred to the chiropodist by the School Medical Officers mainly from the routine school medical inspections, and it appears that approximately 11 per cent. of all children inspected at school were in need of remedial treatment for their feet. Chiropody is a true preventive service, educative as well as remedial, and it should be our aim to enable people to stand on their own feet physically as well as metaphorically. Almost without exception the mothers of these children have expressed the wish that this service had been available to them in earlier years, and I trust that it will be found possible in the future to expand this service considerably.

Unfortunately it has not yet been found possible to obtain the services of a Speech Therapist with the result that children who would benefit, perhaps very greatly, by this treatment, remain untreated.

Page Environmental Hygiene.

During the year there were 263 ash pit conversions and this scheme may now be regarded as completed. The next thing which will be required to be tackled is the conversion of privies to water closets wherever possible. There are approximately 526 privy midden compartments in use, and of these it is estimated that approximately 361 will be capable of conversion.

Pages Milk Supplies. 36, 37

Once again the routine visiting and sampling of all milk premises in the area has been carefully carried out, but I look forward to the achievement by 1954 of milk supplies which are either tuberculin tested, attested or pasteurised. This will represent a tremendous advance in eradicating much of the disease and misery which is caused by impure milk, particularly that which is infected with bovine tuberculosis.

Page Food Hygiene.

Our policy in regard to the supervision of food cleanliness and the proper handling of foodstuffs has again been that of the personal approach. All food premises are visited periodically by the Sanitary Inspectors, and advice is given where it appears to be necessary. It is my opinion that an adequate and capable staff of Inspectors is the best answer to this problem, and I feel that much expenditure of time and money can take place in connection with propaganda and "stunts" to little purpose.

Page Water.

With the exception of five houses the whole of the Spenborough area is supplied by mains water which is pure and of good organic quality. There is one well in the district, and this is kept under constant supervision.

Page Housing.

During the year 218 new houses were erected but the standard of housing in the area will be for a long time yet, much lower than it ought to be, and a great amount of work in connection with inspection and remedying of existing defects will continue to be required. It is estimated, approximately, that 1,200 existing houses are sub-standard and the need for a proper housing survey is very evident. It is all very well to say that we are building as many houses as we are able to and that we should continue to build to the limit for years yet, but I think it would be a benefit to all to know exactly what we have to aim at to achieve a satisfactory sanitary district. Such a survey should be carried out nationally in order to avoid reduplicaiton of work. It would appear that a long time will elapse before a progressive slum clearance policy becomes possible. It is also evident that there is a great deal of over-crowding of all degree likely to exist for many years, and here again the survey is necessary.

Page Smoke Abatement.

It seems that there is no likelihood whatever of this problem being effectively tackled in the forseeable future. In the meantime, all that can be done is by accumulation of evidence of the distressing effect of atmospheric pollution, and dealing as best as one can under existing legislation with the worst offenders. The weapon of public opinion would seem to be our biggest hope for the future.

Conclusion

I wish once again to thank the Chairman and members of the Health and Maternity and Child Welfare Committees for their continued support and encouragement throughout the year. Your Committee, like others in the past, has endeavoured, not without success, to provide a good preventive medical service in so far as lay within its power and in so far as seemed essential, for the least financial expenditure, and I have not, during my term, found you unwilling to spend if the subject has been regarded as essential for the welfare of your ratepayers. The responsibility for most of these services has now passed to the County Council, and with the conception of preventive medicine and of social medicine expressed in the National Health Service Act, scope is provided for great expansion. It is my hope that the expansion will take place only in what is essential, and that

good value will be given for the money which will be expended. After all, one of the greatest social services is that people should have the education, and not least, the money, in their own pockets to fend for themselves. Personally I very much regret that the means have not yet been found to enable local committees to play their part in the administration of these services as they affect their own area.

I wish to thank Mr. Templeman, the Chief Sanitary Inspector, for the report he has made to me of the sanitary circumstances of the area, and all members of the staff for their loyal and willing work in a trying year. I greatly admire the spirit in which they have co-operated with each other, and in which they have accepted new ideas, new methods, and in some cases, new masters.

I am, Mr. Chairman, ladies and gentlemen,

Your obedient servant,

W. M. DOUGLAS,

Medical Officer of Health and Divisional Medical Officer.

PREFACE THE HEALTH SERVICES OF SPENBOROUGH FROM 1920

In 1916 the Urban District of Spenborough was formed by the amalgamation of Cleckheaton, Liversedge and Gomersal, each of which districts had a part-time Medical Officer of Health until 1920, when a whole-time Medical Officer of Health was appointed to the combined districts. By the end of that year (1920) the staff of the Health Department consisted of one whole-time Medical Officer of Health, three part-time Health Visitors and School Nurses, a Chief Sanitary Inspector and an Assistant Sanitary Inspector.

At that time there were no Infant Welfare or Ante-natal Clinics, but the Health Committee gave permission for the free issue of Glaxo to necessitous cases.

In 1920 also Spenborough became an autonomous education authority under part III of the 1902 Education Act, and became responsible for the medical inspection and treatment of the children attending schools in the district. No routine medical inspection at schools had been carried out subsequent to the outbreak of war in August, 1914. In 1920 a scheme for the routine medical examination, and for cleanliness inspections were instituted and schemes for the treatment of enlarged tonsils and adenoids, dental defects and ringworm of the scalp were proposed.

In 1921 it had still not been possible to open any clinics, but 1,195 lbs. of Glaxo were distributed free of charge, and 2,716 at cost price, and in several of the schools meals were provided at a cost of 6d. each These measures were instituted to help counter the adverse defects of economic depression upon the children of the area. It is noteworthy that in this year the Board of Education refused sanction for the appointment of a School Dentist or for the installation of equipment for the treatment of ringworm by X-rays. There being no Clinic to which children could be referred, a system for the treatment of minor ailments at schools by School Nurses was instituted.

In 1922 the present premises at Valley Road were opened and served as Headquarters of the Health Department and also as the first of the Baby Clinics in the area. This year 2,913 lbs. of Glaxo were distributed free of cost and 7,943 lbs. at cost price. There were 1,233 attendances at the new Infant Welfare Clinic during the year.

In 1923 the Infant Welfare Clinic at Scholes was opened and a Voluntary Committee formed. The Board of Education continued to refuse sanction for the installation of X-ray for the treatment of ringworm, but permitted the appointment of a School Dentist to devote two-fifths of his time to Spenborough and three-fifths to Batley. In 1924 a School Dentist was appointed and a fourth Health Visitor and School Nurse was also added to the staff.

In 1925 the first Ante-Natal Clinic was opened and 18 expectant mothers made 20 attendances (total in seven months). In 1926 the Gomersal Nursing Association was formed; 2,679 lbs. of dried milk were distributed free (economic depression during coal strike). The Liversedge Abattoir was opened during this year.

In 1927 a Consultant Ophthalmic Surgeon was appointed to carry out refraction in children with defective vision. One-tenth of the expectant mothers of the area were now attending the Ante-Natal Clinic.

In 1931 the Child Welfare Clinic was started at Cleckheaton,

In 1937 the districts of Birkenshaw, Hunsworth and Hartshead were amalgamated in the Spenborough Urban District, raising the population to 36,029 and the area to 8,160 acres. The fifth Health Visitor and School Nurse was appointed and a third Assistant Sanitary Inspector. The Midwives Act of 1936 was implemented, five midwives employed by the West Riding County Council carrying out their duties in the Spenborough area. The powers of administration were delegated to the Spenborough Council and Maternity and Child Welfare Clinics at Birkenshaw and Roberttown were also brought under the administration of the Spenborough Council. In this year a Home Help Scheme for expectant mothers was started and a full-time dentist was appointed.

In 1939 the present premises at Elm Bank were taken over and Antenatal, School, Infant Welfare and Dental Clinics commenced. In 1940 the first full-time Deputy Medical Officer of Health was appointed and in 1941 a Child Welfare Clinic was opened at Gomersal. In this year a Consultant Obstretician and Gynæcologist was appointed.

In 1942 Tenlands Nursery was opened.

In 1943 the Moorend Day Nursery was opened.

Also the administration of the Ambulance Service came under the Health Department for the first time. A 24 hours service was maintained, employing three ambulances and three drivers.

Attendances at the Council's Child Welfare Centres

Population									
The population of the original Urban District of Spenborough at the 1931 census was 30,963 and the population of Birkenshaw, Hunsworth and Hartshead which were added to the original Urban District in 1937 was 5,066, giving a total population at that time of 36,029. The Registrar-General's estimate of the population of the enlarged Urban District of Spenborough for the middle of 1948 is 36,640, and this figure is used throughout this Report in calculating rates.

Death-rate per 1,000 live birth 40.5

Death-rate of legitimate infants per 1,000 legitimate live births 43.9.

There were 646 live births during the year which is 110 less than in 1947 and the same as in 1946; the birth-rate at 17.63 has consequently decreased from the record figure of last year and is lower than the average for England and Wales (17.9).

The stillbirth-rate of 28.6 per 1,000 live and stillbirths shows a decrease of 4.6 per 1,000 over the previous year. Seventeen of the stillbirths occurred in legitimate pregnancies and two in illegitimate pregnancies.

Deaths

The number of deaths registered in the district in 1948 was 322. From this must be deducted four deaths of persons resident outside the district who died within its boundaries, and to them must be added 145 deaths of residents who died elsewhere. This gives the number of net deaths as 463, equal to a rate of 12.6 per 1,000 estimated population, compared with 12.4 in 1947. The death-rate is higher than that for England and Wales (10.8) and that for districts with a similar population throughout the country (10.7). Over a quarter of the deaths were caused by heart disease (123), and other chief causes were Cancer (86), and Intra-Cranial Vascular Lesions (68).

Of the 27 instances of death within the first year of life occurring in 1948, the most frequent causes were prematurity (nine cases) pneumonia (four cases) and gastro-enteritis (three cases). The death-rate of infants under one year of age per 1,000 live births is 40.5 (30.4 in 1947) which is higher than that for England and Wales (34).

DIPHTHERIA IMMUNISATION

A good response continued to be shown by parents to the appeal that their children should be immunised against diphtheria. Immunisation is undertaken at School Clinics, Child Welfare Clinics, special school sessions, and by general practitioners. The following table gives particulars of the number of children immunised during the year.

Period	Under 5	5—14	Re-Inforcing
Six months ending 30th June, 1948	292	253	67
Six months ending 31st December, 1948	248	21	4 6
Total	540	274	113

TABLE SHOWING THE STATE OF DIPHTHERIA IMMUNISATION 1943-1948

Number of children immunised for the first time during each half

y car v		First half year	Second half year	Total
1943	• • •	462	155	617
1944	•••	145	188	333
1945	•••	207	218	425
1946		318	219	537
1947	•••	150	390	540
1948	•••	545	26 9	814

From the records which we have readily available it would appear that approximately 51 per cent. of children aged one to five years, and 77 per cent. of children aged five to fifteen years have been protected against diphtheria. Records for past years, however, are not readily available, and enquiry is proceeding to try to obtain a fuller picture of the state of immunisation of the children of the district. I confidently anticipate that when this information is available it will be found that a much higher percentage, particularly children of school age, have been so protected. Largely as a result of this measure diphtheria has become a rare disease, but there seems little doubt that should our efforts be relaxed the disease may once more reach epidemic proportions.

TUBERCULOSIS

The Tuberculosis service in Spenborough is administered by the West Riding County Council with the weekly clinic which is held in the Council Offices, Knowler Hill, Liversedge. The following table gives particulars of the age groups of new cases notified, together with similar information regarding the five deaths which occurred from this disease during the year.

MIDWIFERY

The West Riding County Council is the local supervising authority under the various Midwives Acts, and the work of the midwives is coordinated through the local Health Department. Five midwives were available to Spenborough residents until 30th June, 1948, when one resigned, and it was not until the middle of October that an appointment was made to fill this vacancy. 291 women were attended to in their homes. This is a large decrease from the very high figure of the previous year (477) and is to be accounted for by the falling birth-rate and the increase in confinements which took place in hospital.

Work done by midwives:

(a) Labours	conducted
-------------	-----------

(i) As midwife	•••	• • •	• • •	•••	• • •	• • •	•••	206
(ii) As maternity	nurse	• • •	•••	• • •	• • •	• • •	•••	85

(c) Post-natal visits	• • •	•••	•••	• • •	•••	• • •	• • •	5 ⁶ 75

The midwives are in possession of gas and air machines and, when recommended by a doctor, gas and air analgesia is available to patients during labour. During the year 81 women availed themselves of this service.

The hospitalisation of maternity cases takes place mainly in Staincliffe General Hospital and Crossley Maternity Home, and the following figures relate to the whole year:—

INFANT WELFARE CENTRES

The number of attendances at the Council's Infant Welfare Centres for the whole year was 9686, showing a further slight increase over last year's record figure of 9630. The following table shows attendances, etc., at the various clinics, and is so set out to show all details before and after the Appointed Day.

- (a) Relates to the period 1st January, 1948, to 4th July, 1948.
- (b) Relates to the period 5th July, 1948 to 31st December, 1948.

Number of children under five years of age who first attended at the centres during the year and who on the date of their first attendance were:—

- (a) Under one year of age—538.
- (b) Over one year of age-77.

Number of children under five years of age who attended at the centres during the year, and who at the end of the year were:—

- (a) Under one year of age-451.
- (b) Over one year of age—812.

Particulars follow of the total attendances of all cases and also the number of new cases which attended in each of the past five years at all Infant Welfare Centres.

Year	Total attendance of all children	Total children attending for the first time
1944	7386	
1944	7801	5 99
1946	7997	679
1947	9630	813
1948	9686	615

At these clinics medical consultations are available. Babies are weighed and the nurses in attendance give advice and demonstrations on management to the mothers. By arrangements with the Ministry of Food, the Welfare Foods can be bought, and, in addition, a wide range of infant foods are sold.

HEALTH VISITORS

The following figures show the extent of domiciliary visiting achieved by the Health Visitors during the past years. Further staff is required if a satisfactory level of domiciliary visiting is to be obtained, but the figures show that the staff available in this area have done all that could be expected to make the domiciliary visiting the focal point of this work. The tasks and duties which are being piled on the modern Health Visitor make it at once apparent that she is the general practitioner of the preventive medical services, and perhaps the most valuable of our socio-medical field workers.

Number of visits paid during the year by all Health Visitors:—

- (a) To expectant mothers:—
 - (i) First visits—111.
 - (ii) Total visits—188.
- (b) To children under one year of age: -
 - (i) First visits 646.
 - (ii) Total visits—2401.
- (c) To children between the ages of one and five years:—
 - (i) Total visits 2644.

PROBLEM FAMILIES

During the year there were 18 problem families under constant supervision, and the Health Visitors made a total of 116 home visits to these families. No compulsory removals of children from their parents because of cruelty or neglect took place during the year. The aid of the inspector of the N.S.P.C.C. was sought on several occasions and all cases were fully discussed with him with a view to achieving co-ordination of work and so that no avenue of approach to these cases might be neglected. School teachers have also co-operated most helpfully.

HOME NURSING SERVICE

Prior to 5th July, 1948, there were in Spenborough four District Nursing Associations which employed five Nurses, all of whom were "Queen's" Nurses. From the Appointed Day under the National Health Service Act, 1946, the West Riding County Council took over the functions of these Associations for all purposes, all the nurses being transferred.

The following information relates to the work undertaken by the district Nurses since 5th July, 1948, up to the end of the year.

(a)	Number o	of cases	being	attended	on	5th	July,	1948	•••		•••	65

(c)	Number o	f visits	paid b	oetween 5	th J	uly	and 4	end of	year	• • •		6741

HOME HELP SCHEME

The number of Home Helps employed at the beginning of the year was two, and this was the number employed on 5th July, 1948. By the end of the year this number had risen to nine, and the demand for this service was greatly increasing. The following figures show the numbers and types of cases provided with Home Help during the year.

CHIROPODY

The Chiropodist held his first session at Elm Bank Clinic on 9th September, 1948, and a total of 33 half-day sessions were held during the remainder of the year. A total of 119 cases were seen by the Chiropodist, and at the year end there were still 27 cases on the waiting list to be seen. The 119 cases seen made 434 attendances and the following table gives the types and numbers of conditions treated.

D e fect		Nun	nber	Defect	Defect

Number under observation for squint	•••	• • •	6

CLEANLINESS INSPECTIONS

Three routine cleanliness inspections were carried out at each school by the school nurses and a total of 10,953 inspections and re-inspections were carried out. In 1,002 instances the condition was reported to be unsatisfactory. Thus the presence of nits was recorded in 910 cases, pediculi in 41, dirty heads in 17, and dirty bodies in 34. The condition of several children was unsatisfactory on more than one occasion. It should be pointed out that in the majority of cases the degree of infestation is extremely light.

The remedial procedure adopted on the discovery of these defects is to notify the parents informally in the first instance, visiting, if necessary, to give advice on the methods of dealing with infestation. If cure is not effected the nurse visits the home and interviews the parents and finally, if it is evident that insufficient care is being exercised, the Statutory Notice under the Education Act, 1944, is sent requiring the child to be cleansed to the satisfaction of the Medical Officer or of the person appointed by him for that purpose within 48 hours.

SPECIAL EXAMINATIONS

In accordance with the requirements of the Education Act, 1944, a number of children have been referred by the Education Authority which have necessitated the arrangement of special examinations. Twenty-seven such children were examined during the year out of which eleven were physically handicapped, seven maladjusted and nine educationally sub-normal. Six children were referred to the Child Guidance Clinic for investigation or treatment.

MINOR AILMENTS

Minor ailments are treated by the nurses both at the clinics and in the schools. The following table gives details of such treatments during 1948.

	No dealt		
Minor Ailment	Clinics	Schools	Total
Skin—

The following section of the report has been supplied to me by the Chief Sanitary Inspector concerning the sanitary circumstances of the area and of the work of the Sanitary Inspectors in accordance with the Sanitary Officers' (Outside London) Regulations, 1935.

FACTORIES ACT, 1937

Factories (Mechanical and Non-Mechanical)

There are 341 factories in the area. Of these 275 are factories with mechanical power and 66 without. 226 inspections and 82 revisits were made of these premises and the following improvements were carried out:—

Improvements

Artificial lighting provided to conveniences		• • •	37
Dirty walls of W.C.s cleansed			
Insanitary conveniences replaced			
W.C. apparatus repaired			
Lack of intervening ventilated space to W.C. compartments			3
Insufficient ventilation to W.C. compartments	•••	• • •	29
Separation of sexes			_
Fastenings provided to doors of W.C. compartments			
Provision of thermometers in workrooms			Ī
Outworkers			

Eighteen persons in the district were notified to the Department during the year. These were all engaged in the making of wearing apparel for firms outside the area. The premises were visited and all were found satisfactory.

No difficulties were encountered in the administration of the Factories Act. It was not necessary to institute proceedings during the year, as all informal notices were complied with.

Two hundred and fifty-nine inspections were made of dairies and cowsheds. Some cowsheds in the area are still not up to the required standard. With the increase in supplies of certain building materials it should be possible, in the near future, to effect the necessary improvements. It should be pointed out however, that, although good buildings and equipment are important, these are no use unless the farmer practises clean methods of milk production.

(3) Milk Sampling

The following tables show the number of samples taken by the Department and by the West Riding County Council.

Spenborough Health Department

			_	32	2	34

The number of unsatisfactory milk samples indicates that methods of milk production can be improved. Producers are notified of the results of all samples taken. In the case of an unsatisfactory sample, the farm is visited and methods of production are closely examined. Advice is given as to the probable cause and repeat samples taken. It was not necessary to take statutory action against any producer. As a general rule, milk producers are fully aware of their responsibilities to the public.

(4) Examination for Bacillus Tuberculosis

During the year 20 samples of milk were submitted by the Department for examination for tuberculosis. Nineteen were found negative and one positive. As a result of the positive sample, one cow was slaughtered under the Tuberculosis Order. A repeat sample was taken at the farm and the result was negative.

Two cows from dairy herds in the area were slaughtered under the Tuberculosis Order as a result of routine veterinary examination. Two cows from herds outside the area were slaughtered at Spenborough Abattoir under the Tuberculosis Order as a result of veterinary examinations.

The danger to the public in the sale of milk infected with tuberculosis has always been apparent, but, unfortunately, there has been insufficient legislation to deal effectively with the problem. At last, however, as a result of the new Milk (Special Designations) Bill certain safeguards will be given to the public when it becomes law. The long-term policy is the eradication of tuberculosis in herds on an area basis, and this will take a considerable time. In the meantime, according to the terms of the Bill, only approved kinds of milk may be sold, namely Tuberculin Tested (Certified) Milk, Tuberculin Tested Milk, Accredited Milk from a single herd, Pasteurised Milk and Sterilised Milk. By 1954 it is anticipated that only the sale of Pasteurised and Tuberculin Tested Milk will be allowed.

B.—MEAT INSPECTION

(c) Proceedings under Sections 11 and 13 of the Housing Act, 1936.

- Orders were made

The Council also accepted undertakings from owners in fourteen cases stating that they agreed not to re-let houses for human habitation.

(d) Proceedings under Section 12 of the Housing Act, 1936.

- (I) Number of separate tenements or underground rooms in respect of which Closing Orders were made
- Number of separate tenements or underground rooms in respect of which Closing Orders were determined, the tenement or room having been rendered fit

Many problems have faced the Department in this branch of the work during the year. The standard of housing is low and a great amount of slum clearance work will be necessary. It is estimated that there are 1200 houses in the area requiring demolition as a first instalment in a Clearance Area Programme.

Once again difficulties have been experienced in the repair of houses. Complaints are continually being received from tenants occupying houses which are unfit for human habitation and in normal times these would be demolished. It is obvious that first-aid repairs are necessary but the position is aggravated by the low rents paid by a large number of tenants in this district. Although the cost of repairs has been increased, no corresponding rent increases have been allowed. It is essential that something be done to alter this state of affairs. It is estimated that 60 per cent. of the 12,000 houses in the area have a rateable value of £10 and less. Rents of these properties are therefore low and owners are unable to keep them in a proper state of repair.

No reliable figures are available with regard to the extent of over-crowding in the area. During the year, the Council re-housed for families who were living in overcrowded conditions. The worst cases of overcrowding have now been dealt with. Besides overcrowded cases still to be re-housed there must be a large number of houses where sexual overcrowding occurs. This is due to the number of small houses consisting of one living room and one bedroom, or one living room and two bedrooms, of which one is usually little more than a boxroom. In my opinion it is essential that a National Overcrowding Survey be carried out as soon as possible in order to ascertain the degree of overcrowding in the country and the standard by which such overcrowding should be judged should be a bedroom standard and not one based on the total number of habitable rooms in a dwelling.

PRIVIES

The following table summarizes the extent of this type of convenience throughout the area:—

ASHPITS ABOLITION SCHEME

During the year, the above Scheme was completed and the final figures are as follows:—

Notices served
783

Bins supplied
2524

Ashpits abolished
640

VERMINOUS PREMISES

During the year no Council houses were found infested with vermin. Nineteen other houses in the district were found to be verminous and all were disinfected with H.C.N. or D.D.T. In addition the household effects of 34 houses were fumigated with H.C.N. before removal to Council houses.

A total of 250 visits were made to verminous or unclean premises.

RODENT CONTROL

Rats and Mice (Destruction) Act, 1919 Infestation Order, 1943

During the year 28 infestations were dealt with. The necessary poisoning treatments as laid down by the Ministry of Agriculture and Fisheries (Rodent Division) were carried out.

Two hundred and seven visits and re-inspections were made.

SHOPS ACTS

The number of shops in the area is 200. A total of 247 inspections was made. Two contraventions of the Act were found and both were remedied after informal action.

The following work was done:—
Suitable sanitary accommodation provided.

OFFENSIVE TRADES

There are two offensive trades registered in the district. One Tripe Boiler. One Soap Boiler. Four inspections were made and no nuisance found.

SMOKE ABATEMENT

Seventy-eight observations of 30 minutes duration were taken during the year. Of these 17 were unsatisfactory.

Contraventions over permitted three minutes black smoke in 30 minutes.

Up to 1 min.

1 to 2 mins.

2 to 3 mins.

3 to 4 mins.

4 to 5 min.

5

More than 5 mins.

2

One factory gave considerable trouble during the year and many complaints were received concerning it. Observations were taken at varying times and in varying climatic conditions. The occupier was interviewed with the result that extensive alterations to the plant were carried out. Particular attention was paid to those premises where black smoke emission was known to be excessive. There is no doubt that much of the nuisance is due to faulty methods of stoking and not to the fuel which is often blamed by those responsible.

During the year the Executive Council of the National Smoke Abatement Society requested Local Authorities to co-operate in making a National Survey of the Sources and Incidence of Atmospheric Pollution. The Health Department made a survey and forwarded the results to the Society. As part of the survey a questionnaire was circulated to 148 firms in the district and 124 replied. The following information was obtained: 1—Type of Boilers. 2—Use. 3—Fuel. 4—Stoking appliances. 5—Draughts. 6—Chimney.

SALVAGE

The following salvage was collected from January 1st to December 31st, 1048:—
